

Background :

Indonesia's deforestation rate fell from 0.12% in 2021 to 0.10% in 2023, but rose again to 0.19% in 2024, showing that forest loss remains a serious environmental challenge.

The recent rise in deforestation in 2024 proves the fight is not over illegal logging still destroys forests and triggers disasters. This is our collective wake-up call. Let's unite, demand action, and protect our forests for a safer, sustainable future. Our role matters now.

Sustainable Development

For The Future Of Our Bright Generation

Between year 2015 and 2020, primary forest had been lost at over 324,000 hectares per year due to illegal logging and agricultural expansion.

VoxSilva

Voxsilva is an innovative tool that is very beneficial for the future. This technology is designed to help preserve forests, especially in the face of the threat of illegal logging. With accurate detection and monitoring capabilities, Voxsilva is an effective solution to keep forests safe and sustainable.

Main Feature

1

Sensor Network

A connected system of sensors that collect and share data.

2

LORA (Long Range Distance Communication)

A long-range, low-power wireless technology for communication.

3

Remote Monitoring

Watching and analyzing data from a distance without being there physically.

Methods :

1

System Architecture

2

Hardware Development

3

IoT Network Configuration

4

Software and Coding Implementation

5

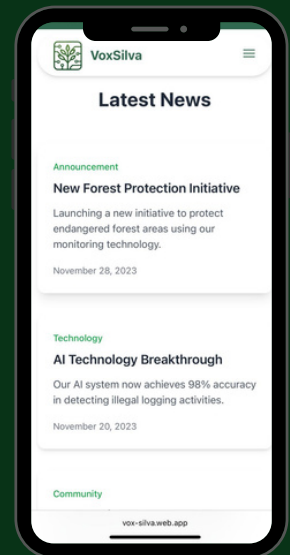

System Evaluation

Together, let's protect forests and stop illegal logging for a sustainable future.

Actions that can be taken

- Rapid Responses
- Forest Monitoring
- Law Enforcement Support
- IoT-Enabled System
- Data-Driven Decision Making
